9. References and Sources

1. Defining Professional Learning Communities

What Constitutes a "True" PLC?

A professional learning community (PLC) is not simply a meeting or a committee. At its core, the research defines a PLC as "an ongoing process in which educators work collaboratively in recurring cycles of collective inquiry and action research to achieve better results for the students they serve" (DuFour, DuFour, Eaker, & Many, 2006). The critical word is process—not a program to adopt, but a fundamental transformation of how educators work together.

The DuFour Model

Richard DuFour and Robert Eaker published Professional Learning Communities at Work (1998), the seminal text that brought PLCs into mainstream educational practice. DuFour further refined the definition in his widely cited 2004 Educational Leadership article, arguing that a PLC requires staff to "focus on learning rather than teaching, work collaboratively on matters related to learning, and hold itself accountable for the kind of results that fuel continual improvement."

The Three Big Ideas

- A Focus on Learning — The fundamental purpose of the school is to ensure all students learn at high levels. The shift is from "Was it taught?" to "Was it learned?"
- A Collaborative Culture with Collective Responsibility — Educators work together and take collective responsibility for the success of each student.
- A Results Orientation — Effectiveness is assessed on the basis of tangible evidence of student learning, not intentions or effort.

The Four Critical Questions

- What do we want students to learn? (Essential standards/guaranteed curriculum)
- How will we know when they have learned it? (Common formative assessments)
- How will we respond when some students do not learn? (Systematic interventions)
- How will we extend the learning for students who are already proficient? (Enrichment)

Six Characteristics of a PLC (DuFour & Eaker, 1998)

- Shared mission, vision, values, and goals
- Collaborative teams focused on learning
- Collective inquiry into best practice and current reality
- Action orientation and experimentation
- Commitment to continuous improvement
- Results orientation

Competing and Complementary Frameworks

Shirley Hord's Five-Dimension Model (1997)

Shirley Hord at the Southwest Educational Development Laboratory (SEDL) published one of the earliest formal PLC frameworks a year before DuFour and Eaker. Her five dimensions:

- Supportive and Shared Leadership — Administrators and teachers jointly question, investigate, and seek solutions.
- Shared Values and Vision — Staff collectively develops a vision guiding decisions about teaching and learning.
- Collective Learning and Application — Acquiring and applying new knowledge as a high priority.
- Supportive Conditions — Both structural (time, communication, school size) and relational (trust, respect, caring).
- Shared Personal Practice — Teachers observe one another, provide feedback, and share practice openly. Hord noted this is typically the last dimension to develop.

Hord's dimensions were operationalized in the Professional Learning Community Assessment-Revised (PLCA-R), a validated 52-item instrument with internal consistency coefficients ranging from .83 to .93 (Olivier, Hipp, & Huffman, 2003/2010).

Other Frameworks

- Karen Seashore Louis and Sharon Kruse (1995) — Developed "school-based professional community," blending professionalism with community. Found that in schools where professional community is strong, teachers work together more effectively and put more effort into student learning opportunities.
- McLaughlin and Talbert (Stanford, 2001/2006) — Nearly two decades of research on secondary teaching. Found that departmental cultures play a crucial role—professional community operates at multiple organizational levels.
- Louise Stoll et al. (2006) — Major international review defining a PLC as "a group of people sharing and critically interrogating their practice in an ongoing, reflective, collaborative, inclusive, learning-oriented, growth-promoting way."
- Peter Senge (1990) — The Fifth Discipline provided foundational intellectual infrastructure. DuFour and Eaker translated Senge's learning organization concept for the education sector.
- Etienne Wenger (1998) — Communities of Practice provided theoretical grounding for understanding how learning occurs through social participation.

"PLC Lite" — The Label Applied Loosely

DuFour and Reeves (2016) published "The Futility of PLC Lite" in Phi Delta Kappan, specifically addressing superficial implementation. Hallmarks of PLC Lite include:

- Renaming traditional faculty or department meetings as "PLC meetings" without changing substance

- Book studies that result in no action
- Devoting collaborative time to topics with no effect on student achievement
- Creating formative assessments that merely mimic state tests
- No processes for collective analysis of student data
- Recycling previously unsuccessful teaching practices as "interventions"

DuFour himself warned that "PLCs may lose their credibility as an important part of education reform unless educators think critically about the fundamental concepts which make up the model."

Core Components Across All Frameworks

Component	DuFour & Eaker	Hord	Louis & Kruse	Stoll
Shared purpose/vision	Yes	Yes	Yes	Yes
Collaborative work	Yes	Yes	Yes	Yes
Collective inquiry into practice	Yes	Yes	Yes	Yes
Focus on student learning outcomes	Yes	Implied	Yes	Yes
Shared/distributed leadership	Implied	Yes	Yes	Implied
Supportive structural conditions	Implied	Yes	Yes	Yes
Data-driven decision making	Yes	Implied	Implied	Yes

2. Evidence of Effectiveness

Overview of the Evidence Base

The PLC evidence base is substantial in volume but uneven in rigor. The literature ranges from large-scale meta-analyses to individual case studies, with the majority falling in the correlational and descriptive categories. Critically, there are almost no randomized controlled trials of PLCs. Below are the major studies, organized by methodological strength.

Meta-Analyses

Lomos, Hofman, and Bosker (2011) — The Key Meta-Analysis

This is the most rigorous quantitative synthesis directly examining the PLC-to-student-achievement link. Published in School Effectiveness and School Improvement.

- Summary effect size: $d = 0.25$ ($p < .05$) — a small but statistically significant positive effect.
- Synthesized studies investigating the direct relationship between degree of professional community and student achievement.
- Authors noted significant conceptual and methodological difficulties: no universal definition of "professional community" has been formulated, and its operationalization differs across studies.

This $d = 0.25$ is the most defensible estimate of PLC impact on student achievement available in the literature.

Burns (2013) — Dissertation Meta-Analysis

- Analyzed 21 dissertations (1997–2012) quantitatively linking PLC characteristics to student achievement.
- The hypothesis that PLC implementation increases math achievement was NOT supported.
- The hypothesis that PLC implementation increases reading achievement was partially supported.
- Shared/Supportive Leadership and Shared Vision were the most influential PLC dimensions.

Major Reviews

Vescio, Ross, and Adams (2008)

Published in Teaching and Teacher Education. Examined 11 empirical studies on PLC impact.

- All 11 studies found PLCs shifted professional culture toward greater collaboration.
- 8 of 11 studies documented improvement in student test scores or other achievement measures.
- Student achievement increased most where PLCs were highly developed and teachers focused persistently on student learning data.

- Critical caveat: Few studies moved beyond teacher self-reports of positive impact. Evidence relied heavily on case studies and correlational designs.

Stoll, Bolam, McMahon, Wallace, and Thomas (2006)

Major international review in Journal of Educational Change. Synthesized conceptual and empirical literature. Found PLCs hold "considerable promise" for capacity building for sustainable improvement, but this was a narrative review without effect sizes.

Quasi-Experimental and Correlational Studies

Barnes and McKenzie (2024) — The Arkansas Study

This is one of the most important recent studies—the most rigorous quasi-experimental evaluation of the PLC at Work model, conducted by the University of Arkansas Office for Education Policy.

- No statistically significant improvements in overall student achievement or growth were observed.
- Students in PLC at Work schools showed a 0.721-point decrease in average weighted achievement compared to non-PLC schools.
- Economically disadvantaged students showed a 1.026-point decrease.
- Some cohorts showed temporary positive effects in ELA growth, but these did not persist.
- The study raised "concerns about the program's current effectiveness."

Context: Between July 2017 and January 2024, Solution Tree and its affiliates were paid $144.6 million from Arkansas education entities for PLC at Work implementation.

Goddard, Goddard, and Tschannen-Moran (2007)

- Surveyed 452 teachers and assessed 2,536 fourth-grade students across 47 elementary schools.
- After controlling for student characteristics and school social context, teacher collaboration was a significant positive predictor of student achievement differences.
- One of the stronger studies because it controlled for confounders.

Ronfeldt, Farmer, McQueen, and Grissom (2015)

- Analyzed 9,000+ teachers in 336 Miami-Dade County schools over two years.
- Schools with better quality collaboration had better achievement gains in math and reading.
- Teachers improved at greater rates in schools with better collaboration quality.

Goddard, Hoy, and Woolfolk Hoy (2000)

- Collective teacher efficacy (CTE) was positively associated with student achievement in both reading and mathematics.
- A one-unit increase in CTE corresponded to an 8.62-point gain in math and 8.49-point gain in reading.
- CTE was a stronger predictor of student achievement than socioeconomic status.

The Hattie Effect Size — A Critical Clarification

John Hattie's Visible Learning synthesis reports an effect size of d = 1.57 (updated to d = 1.36) for collective teacher efficacy—by far one of the largest in his database of 250+ influences on student achievement. This figure is frequently cited by PLC advocates.

However, this must be understood carefully:

- The d = 1.57 measures the association between the belief construct of collective teacher efficacy and student outcomes.
- It does NOT measure the effect of implementing PLC structures.
- PLCs are theorized to build collective efficacy, but the effect size measures the belief, not the organizational intervention.
- The actual meta-analytic effect of PLCs on achievement (Lomos et al.) is d = 0.25—substantially smaller.

The gap between d = 1.57 (collective efficacy as a belief) and d = 0.25 (PLCs as implemented) is one of the most important distinctions in this literature. Conflating the two overstates the evidence for PLCs.

Effect Size Summary

Study/Construct	Effect Size	Type of Evidence
Hattie — Collective Teacher Efficacy	d = 1.57 (original); d = 1.36 (updated)	Mega-synthesis; measures belief construct, NOT PLC implementation
Lomos, Hofman, & Bosker (2011)	d = 0.25	Meta-analysis; directly measures PLC-to-achievement link
Burns (2013) — Reading	Small positive (partial support)	Dissertation meta-analysis
Burns (2013) — Math	Not significant	Dissertation meta-analysis
Barnes & McKenzie (2024)	Null to negative	Quasi-experimental; most rigorous recent study
Goddard et al. (2000)	8.62 pts math / 8.49 pts reading per unit CTE	Correlational study
Kraft, Blazar, & Hogan (2018) — Teacher coaching	d = 0.18 (achievement); d = 0.49 (instruction)	Meta-analysis (relevant comparison)

3. Student Outcome Metrics

Test Scores (Standardized Assessments)

This is by far the most commonly studied outcome. The meta-analytic evidence (Lomos et al., d = 0.25) suggests a small positive association. However, the most rigorous quasi-experimental study (Barnes & McKenzie, 2024) found null-to-negative effects. The majority of positive findings come from correlational studies that cannot establish causation.

Verdict: Mixed evidence. Small positive association in meta-analyses, but null results in the strongest causal design.

Collective Teacher Efficacy (as Mediator)

Strong and consistent correlational evidence that PLCs build collective teacher efficacy, which in turn is associated with higher student achievement (Goddard et al., 2000; Hattie). This is the strongest part of the evidence chain, but it is a mediating mechanism—not a direct student outcome.

Verdict: Strong correlational evidence for the mechanism, but the mechanism does not automatically translate to measured student gains.

Teaching Practice Changes

Fairly consistent evidence that PLCs change instruction—but only when the focus is explicitly on instructional practice rather than logistics. Supovitz (2002) found that collaboration alone did not improve achievement; only collaboration focused on changing instructional practice produced gains.

Verdict: Moderate evidence. PLCs can change teaching, but do not automatically do so.

Graduation Rates

Very limited direct evidence linking PLCs to graduation rates. The literature notes PLCs' potential to improve school connectedness, which is associated with graduation rates, but rigorous direct studies are lacking.

Verdict: Very weak/absent. No rigorous direct evidence.

Attendance

Not a primary outcome in most PLC studies. Indirect theoretical connection through improved engagement, but no major PLC study has directly measured attendance as a primary outcome variable.

Verdict: Very weak/absent. No rigorous direct evidence.

Equity Gaps / Achievement Gaps

Contradictory evidence. Louis, Marks, and Kruse (1996) found that achievement gaps were smaller in PLC-organized schools. However, Barnes and McKenzie (2024) found the opposite: economically disadvantaged students in PLC at Work schools showed negative associations, particularly in math.

Verdict: Contradictory. The evidence does not consistently support PLCs as an equity strategy.

Student Engagement / Social-Emotional Outcomes

Emerging area with thin evidence. Some studies report improved social skills and engagement, but this relies primarily on teacher reports and case studies.

Verdict: Weak/emerging. No meta-analytic evidence.

Summary Table: Strength of Evidence by Outcome

Outcome	Strength of Evidence	Summary
Standardized test scores	Moderate-to-weak	Mixed. Meta-analytic effect small (d=0.25). Strongest quasi-experimental study found null/negative.
Collective teacher efficacy	Strong correlational	Consistent positive association. Measures belief construct, not direct student outcome.
Teaching practice changes	Moderate	Only when PLCs focus explicitly on instructional practice.
Graduation rates	Very weak / Absent	No rigorous direct evidence.
Attendance	Very weak / Absent	No rigorous direct evidence.
Equity / Achievement gaps	Contradictory	Some positive, some negative findings.
Student engagement / SEL	Weak / Emerging	Primarily anecdotal and self-reported.

4. What Makes PLCs Work vs. Fail

Conditions for Effective PLCs

Leadership

The principal's role is consistently identified as the single most important factor. Research identifies several critical behaviors:

- Shared and distributed leadership — Hord's framework identifies this as the first dimension. The "traditional role of omnipotent principal" must be replaced by shared decision-making.
- Role clarity — Principals must clarify whether they are attending PLCs as observer/supervisor, supporter/expert, or participant. Ambiguity creates anxiety and undermines trust.
- Vision-setting with accountability — Setting the instructional vision and then selecting, coaching, evaluating, and holding others accountable for implementation.
- Instructional coaches as mediators — The principal-coach partnership is essential. In effective schools, principals and coaches collaborate to support all aspects of professional learning.

Time Allocation

Time is the most frequently cited structural requirement—and barrier.

- Research recommends at least 60 minutes of embedded collaborative time per week.
- The most effective systems provide 90 consecutive minutes per week for collaboration.
- Reality: More than half of schools report fewer than 60 minutes per week; less than 10% report 90+ minutes.
- Time must be protected and embedded within the contractual day, not added on top of existing responsibilities.

Data Use

- Common formative assessments developed by teacher teams are considered the most powerful PLC strategy.
- The data-action cycle: examine results → identify proficiency levels → share effective strategies → plan interventions → reassess.
- Frequency matters: weekly or biweekly data review meetings are most effective.
- Teams should analyze results by individual learning targets, not just overall test scores.

Teacher Buy-In and Trust

- Psychological safety is foundational. Teachers need to feel comfortable saying "I don't know" and sharing struggles.
- Trust has multiple dimensions: competence, benevolence, reliability, openness, and honesty (Education Northwest).

- Relational trust (Bryk and Schneider) forms through repeated interactions where expectations are met.
- Hord: "The strength of relationships between administrators and staff, and among staff members, is the underpinning of all five dimensions of PLCs."

Accountability Structures

- "Who does what by when" — Meetings end with specific action steps, owners, and deadlines; meetings begin by reviewing previous commitments.
- Products over promises — Action steps should result in a reviewable product.
- Support-first accountability — "The best form of accountability comes through high support," with leaders checking in to ensure team members have what they need.

District-Level Support

- District support is non-negotiable for long-term sustainability.
- Districts must provide: aligned policy, protected time in master schedules, funding for coaching, aligned professional development, and coherent messaging.
- Superintendent engagement signals that PLC work is valued and essential.

Why PLCs Fail

"PLC in Name Only"

- Renaming traditional meetings as "PLC meetings" without changing substance.
- Meetings consumed by logistics (scheduling, supply ordering, announcements) rather than learning.
- Congeniality over collegiality — Teams prioritize being nice over being honest about practice.
- Privacy protection — Teachers resist opening their practice to observation and feedback.

Top-Down Mandates Without Support

Andy Hargreaves' concept of "contrived collegiality" (1991) captures this failure mode. When PLCs are "formally required, predetermined, driven by administrative power, and fixed in time and space, teachers often report disliking PLCs, withhold their trust, and restrict their individual autonomy." Research warns that mandated collaboration "can easily backfire, causing teachers to collaborate even less than before" (Hargreaves, 2019).

Implementation Without Fidelity

- Teams develop common assessments but never analyze results together.
- Schools provide time but offer no facilitation or training on how to use it.
- Systems build the structure but ignore the culture-building necessary for authentic collaboration.
- DuFour: PLC components "are most effective when implemented together." Partial implementation yields limited results.

Teacher Resistance

- Passive non-compliance: Attending meetings but not participating substantively.
- Viewing PLCs as "another initiative" adding to workload without clear benefits.
- Workload-driven resistance: K-12 teachers are the most burned-out workers across professions (44% reporting burnout "always or very often"—Gallup, 2022). Adding expectations without removing duties generates legitimate resistance.

Five Common PLC Challenges (Learning Forward)

- Incoherence — PLC work disconnected from school-wide goals.
- Insularity — Teams become echo chambers rather than seeking outside perspectives.
- Unequal participation — Some members dominate while others disengage.
- Congeniality over collegiality — Teams prioritize being nice over being honest.
- Privacy — Teachers resist opening classroom practice to scrutiny.

5. Criticisms and Limitations

Methodological Weaknesses in the Research Base

- Lack of randomized controlled trials (RCTs). The PLC literature relies overwhelmingly on case studies, survey-based correlational research, and quasi-experimental designs.
- Selection bias. Schools that voluntarily adopt PLCs are likely already higher-functioning and better-led. Positive outcomes may be partly attributable to pre-existing characteristics.
- Positive publication bias. Studies showing null or negative results are less likely to be published or cited.
- Self-report dependence. Much evidence comes from teacher and administrator surveys about their own practices, not independent observation or causal analysis.
- The most rigorous study to date (Barnes & McKenzie, 2024) found null-to-negative results.

Scholarly Critiques

- Diane Wood (2007) in Teachers College Record questioned whether PLCs actually change practice or repackage the status quo. Her research revealed "power struggles, logistical dilemmas, cultural conflicts, and communication problems."
- Larry Cuban (Stanford) questioned the implicit assumption that teacher collaboration will "get teachers to alter routine teaching practices," arguing such reforms rarely penetrate the "grammar of schooling."
- Stoll et al. (2006) acknowledged that "defining, developing, and operationalizing the concept of PLC has proven difficult" and that "the concept has been criticized because it covers school operations too widely."

The Commercial Interest Problem

This is a significant and underexplored issue:

- Richard DuFour was a leading authority on Solution Tree's PLC at Work model. Solution Tree is a for-profit company providing books, conferences, workshops, consultation, and courses.
- DuFour published primarily through Solution Tree's own publishing arm and presented at Solution Tree's conferences, creating a self-referencing ecosystem.
- The Arkansas case illustrates the stakes: Solution Tree received $144.6 million from Arkansas education entities (2017–2024), yet the University of Arkansas study found no statistically significant improvement in student outcomes.
- The distinction between "PLCs" as a general concept and "PLC at Work" as a branded, proprietary product is often blurred.

Standardization vs. Teacher Autonomy

The PLC model's emphasis on common assessments, common pacing, and common instructional strategies can be experienced by teachers as erosion of professional judgment. Hargreaves (2019) documents "conflicts that emerge when efforts at enhancing professional autonomy

conflict with hierarchical and bureaucratic cultures." Research shows PLCs can both promote and constrain teacher innovation depending on implementation.

Sustainability and Diminishing Returns

Research on PLC sustainability notes that "most performance-oriented teacher communities are 'prone to perish when the goal or the mission is completed.'" A 2024 cross-national study of 127,339 teachers in 40 countries found that while PLCs showed a positive relationship with job satisfaction, "relationships with self-efficacy and clarity of instruction are weaker and vary by context"—suggesting diminishing returns on some outcomes.

Areas Where Research Is Thin or Contradictory

Area	Status
RCT evidence on PLCs	Essentially absent
Long-term sustainability (5+ years)	Very thin; most studies are 1-3 years
Impact on non-tested subjects	Almost no research
Impact on graduation rates	No direct evidence
Impact on attendance	No direct evidence
Equity outcomes	Contradictory (positive and negative findings)
Cost-effectiveness	Not studied; no ROI analyses identified
Comparison to alternative PD models	Very limited head-to-head comparisons
Secondary vs. elementary effects	Insufficient disaggregated data
Rural/small district effects	Underrepresented in the literature

6. Tennessee Context

State Policy Framework

Tennessee does not have an explicit state PLC mandate. However, the state's evaluation, professional learning, and leadership frameworks strongly incentivize and support PLC implementation through multiple mechanisms:

TEAM Evaluation System

The Tennessee Educator Acceleration Model (TEAM) explicitly includes PLC participation as an evaluation indicator. Under "School and Community Involvement," teachers are evaluated on being a "productive member of PLCs and grade-level teams." The TDOE published "Connecting TEAM to PLCs" (July 2016), which found that only 53% of Tennessee teachers reported that collaboration was occurring at their schools—indicating significant room for growth.

TVAAS Data Integration

TVAAS data is integral to PLC work in Tennessee. Since 2010, TVAAS has comprised up to 35% of teachers' overall annual evaluations. PLC conversations should incorporate TVAAS data alongside common formative assessment data and student work analysis.

Tennessee Instructional Leadership Standards (TILS)

Standard C requires that effective leaders "design, facilitate, and participate in collaborative learning informed by multiple sources of data." Principals are evaluated on facilitating the development of a highly effective learning community.

Teacher Leader Standards

Tennessee adopted seven Teacher Leader Model Standards (2011). Domain I—"Fostering a Collaborative Culture to Support Educator Development and Student Learning"—directly addresses PLC facilitation. The Tennessee Teacher Leader Guidebook provides implementation models.

Professional Learning Standards

Tennessee adopted Learning Forward's Standards for Professional Learning. The state rubric explicitly states that effective professional learning "occurs within learning communities committed to continuous improvement, collective responsibility, and goal alignment."

Best for All Strategic Plan

The 2019 Best for All plan does not use "PLC" as a standalone initiative but embeds PLC principles through its three priorities (Academics, Student Readiness, Educators). Best for All Central provides free instructional and professional development resources statewide.

Funding and Requirements

- TCA 49-6-3004 requires 5 days or 30 hours of professional development within the 200-day teacher contract.

- In-service time may be used for "school-wide or system-wide instructional planning meetings"—essentially PLC work.
- TISA (Tennessee Investment in Student Achievement) provides over $9 billion in education funding with professional development provisions.
- Centers of Regional Excellence (CORE) provide technical assistance including PLC facilitation, with the First TN CORE serving East Tennessee.

Tennessee District Examples

Oak Ridge Schools (~4,500 students)

The most documented PLC success story in Tennessee:

- Named a Level 5 District (highest TDOE rating) based on 2022-23 TVAAS measures.
- Oak Ridge Elementary School named a Model PLC at Work campus in 2022 by Solution Tree.
- Implemented PLCs throughout all schools with the Plan-Do-Study-Act (PDSA) framework.
- Master schedule designed for common planning and collaboration time.
- Student growth percentiles on state assessments increased each year following implementation.

Johnson City Schools (~8,000 students)

- Frequently ranks in the top five TN districts for achievement and growth.
- Success attributed partly to longstanding culture valuing professional learning from superintendent/board level.
- Core instructional leadership team leads K-12 professional learning.
- Uses Learning Stream PD management software with CANVAS integration.

NIET/TAP Partnership Districts

NIET partnered in developing the TEAM evaluation system. Tennessee districts using NIET/TAP implement PLCs through "cluster groups"—structured PLCs with specific protocols for data-driven instruction. Clinton Elementary School (Clinton, TN) was a finalist for NIET's Founder's Award.

Greeneville City Schools

Named one of only 14 Exemplary Districts statewide in the 2024-25 TDOE report card. Three Reward Schools: Hal Henard Elementary, Tusculum View Elementary, and Greeneville High School. The 2025-2026 calendar includes 11 Professional Development Days—exceeding the state minimum of 5, providing substantial capacity for embedded PLC work.

Educator Preparation in Tennessee

There is no specific state mandate requiring PLCs as a standalone component of educator preparation. However, PLC concepts are embedded through the Teacher Leader Standards, clinical experiences with LEA partners, and program requirements. ETSU's Clemmer College of Education offers relevant graduate programs (M.Ed. in Curriculum & Instruction, Ed.D. in

Educational Leadership) and partners with over 40 LEAs for field experiences that expose candidates to collaborative structures.

7. Implementation Models for Small Districts

The Singleton Challenge

In a district the size of Greeneville City Schools (~2,500 students), most teachers—particularly at the secondary level—are "singletons" (the only teacher of a particular subject or course). This is the defining challenge of PLC implementation in small districts. Three primary models address it:

Model 1: Vertical Content Teams

Teachers of the same content area across grade bands (e.g., all math teachers K-5, 6-8, or 7-12) form teams. This allows content-specific collaboration even when no two teachers teach the same course. Teams focus on vertical alignment of standards and skills progression.

Model 2: Cross-Curricular / Interdisciplinary Teams

Teams focus on enduring skills that transcend content (e.g., writing, critical thinking, data analysis). Once common skills are identified, teams create common rubrics, administer assessments, and collect data. This model works well when content-alike teams are impossible to form.

Model 3: PLC Roundtables

Smaller schools conduct roundtable sessions with rotating, seasonal focuses—for example, sharing formative assessment strategies in September or reviewing end-of-year data in April. All faculty participate, with structured protocols ensuring productive dialogue.

Model 4: Virtual / Cross-District PLCs

Singleton teachers connect with same-subject teachers in neighboring districts via Zoom or other platforms. This is particularly valuable for low-incidence subjects (e.g., AP courses, world languages) where no within-district peers exist.

Scheduling Models

Late-Start or Early-Release

Students arrive late or leave early on a designated day (commonly Wednesday) to provide PLC time. This is the most common model nationally. Example: Mason Public Schools (MI) uses late-start Wednesdays for one hour of PLC time.

Embedded Planning During Specials/PE

Elementary teachers participate in 45-minute grade-level PLCs while students are in PE or specials (2 days per week in some districts). Requires coordination of the specials schedule.

Hybrid Approaches

Alternating between full-length PLC sessions and shorter "check-in" meetings. Even a 30-minute PLC can be high-impact if laser-focused. Key principle: "It's not about more time, it's about better use of time."

Tennessee-Specific Considerations

- State requires minimum 5 in-service days (30 hours) annually.
- In-service time can explicitly be used for "school-wide or system-wide instructional planning meetings."
- Greeneville's 11 PD days exceed the state minimum, providing significant capacity.
- Districts have flexibility in structuring the 200-day calendar.

Common Protocols

Data Analysis Protocols

- ATLAS Looking at Data Protocol — Promotes equity of voice; helps staff describe data, make inferences, and share implications.
- Common Formative Assessment Data Protocol — Teams analyze results by individual learning targets rather than overall test scores.
- Data Wise — Weekly data meetings defining key concepts, identifying gaps based on student work, and preparing reteach plans.

Looking at Student Work

- ATLAS Learning from Student Work Protocol — Structured process for examining student work to identify patterns.
- Tuning Protocol — A presenting teacher shares work and receives warm/cool feedback from the team.
- Consultancy Protocol — Provides assistance in solving problems; includes clarifying and probing questions.

Meeting Structure

- Begin with Connections (3 minutes, listening protocol—helps members be "present").
- Review team norms established by the team.
- Follow a time-managed meeting flow with data-discussion frameworks.
- End with action item tracking ("who does what by when") and next steps.
- Optimal group size: 6–8 participants.

Addressing Constraints in Small Districts

- Front-load PLC foundation work (norms, essential standards, assessment planning) during summer professional development.
- Use stipends for teacher-facilitators to recognize the additional responsibility.
- Alternate between full-length and shorter focused sessions when time is tight.
- Connect singleton teachers with same-subject peers in neighboring districts virtually.
- Integrate PLC protocols into existing meeting times rather than creating entirely new obligations.

8. Bottom Line

The State of the Evidence

The PLC concept is grounded in sound theory: teacher isolation is a well-documented problem, and collaborative professional learning aligns with what we know about adult learning and organizational improvement. The theoretical case for PLCs is strong.

The empirical case is more complicated. Here is a candid assessment:

What the evidence supports:

- PLCs can build collective teacher efficacy, which has a strong correlational link to student achievement (Hattie, d = 1.36; Goddard et al., 2000).
- PLCs can change teaching practice, but only when explicitly focused on instruction and student data—not logistics or compliance (Supovitz, 2002).
- The meta-analytic effect of PLCs on student achievement is positive but small (Lomos et al., d = 0.25).
- PLCs are consistently associated with improved teacher collaboration, reduced isolation, and increased job satisfaction.
- Schools with high-quality collaboration tend to have better student outcomes (Ronfeldt et al., 2015).

What the evidence does NOT support:

- PLCs as a silver bullet. The d = 0.25 effect size is real but modest, and the most rigorous quasi-experimental study (Barnes & McKenzie, 2024) found null-to-negative effects.
- Citing Hattie's d = 1.57 as evidence for PLCs. This conflates a belief construct (collective teacher efficacy) with an organizational intervention (PLC implementation). They are related but not the same.
- PLCs as a guaranteed equity strategy. The evidence on achievement gaps is contradictory.
- Any causal claim from RCT evidence. There are essentially no randomized controlled trials of PLCs.

The Implementation Gap

The most likely explanation for the gap between PLC theory and PLC results is implementation fidelity. DuFour and Reeves' "PLC Lite" phenomenon is real and widespread. When researchers study "PLCs," they are studying a wide spectrum from deeply embedded, data-driven collaborative inquiry to renamed faculty meetings. This measurement noise likely dilutes estimated effects.

The implication: PLCs done well probably work better than the average effect size suggests, but PLCs done poorly—which is the more common condition—may produce no benefit or even harm (as the Arkansas data suggests for disadvantaged students).

For Greeneville City Schools

Several factors position GCS well:

- Exemplary District status and three Reward Schools demonstrate existing instructional strength.
- 11 PD days exceed the state minimum, providing time capacity.
- Small district size enables tighter coordination and shared vision.
- Tennessee's TEAM evaluation already includes PLC participation as a professionalism indicator, creating alignment.
- Nearby examples (Oak Ridge, Johnson City) provide relevant models.

Key risks to monitor:

- The singleton challenge requires creative team configurations (vertical, cross-curricular, virtual).
- PLCs must maintain an explicit, relentless focus on student data and instructional practice—not logistics.
- Buy-in must be developed through trust and demonstrated value, not mandate.
- Sustainability requires ongoing leadership attention; PLCs tend to plateau or revert without it.
- Accountability structures (who does what by when) prevent the drift toward congeniality without substance.

The Honest Summary

PLCs represent a reasonable, theory-grounded approach to professional learning that has modest but real evidence of effectiveness when implemented with fidelity. They are not the transformative, high-effect-size intervention that advocates sometimes claim, but neither are they without value. The key variable is not whether a school "has PLCs" but how those PLCs actually function—what happens in the room, how data is used, whether instruction changes, and whether leadership sustains the work over time.

9. References and Sources
